

Elastic energy storage braking

How does electric energy storage work in a braking system?

Since the energy storage capacity of battery is much greater than the coil spring, the electric energy storage method always participates in energy recovery throughout the entire braking process. The total recycled energy ($E_{sum 1}$) is the sum of the deformation energy of the coil spring and the feedback energy to the power battery.

How to recover brake braking energy efficiently?

Some advanced technologies like "serial 2 control strategy", centralized storage system, and regenerative downshift have been proven to recover brake braking energy efficiently. Because of dense traffic lights in cities, vehicles brake and start up frequently, which results in considerable energy consumption.

What is elastic energy storage - electric power generation system?

With the elastic energy storage-electric power generation system, grid electrical energy can drive electric motors to wind up a spiral spring group to store energy when power grid is adequate, and the stored energy can drive electric generators to generate electrical energy when power grid is insufficient. The working principle is shown in Fig. 2.

How does regenerative braking work?

The regenerative braking system converts the kinetic energy of driving vehicles into elastic potential energy. This process can be modelled and simulated to identify the characteristics of the proposed regenerative braking system. Ignore the influence of wind resistance and heat dissipation on the energy collection efficiency of the system.

What is elastic energy storage?

Compared with the traditional chemical battery, elastic energy storage does not automatically release energy due to self-discharge, therefore the energy can be stored for a much longer time and can be repeatedly stored and released.

What is electro-mechanical braking energy recovery system?

An electro-mechanical braking energy recovery system is presented. Coil springs are used for harvesting the braking energy of a vehicle. The system can provide extra start-up torque for the vehicle. Efficiencies of 0.56 and 0.53 are obtained in the simulation and experiments.
