

How is the energy storage cloud platform

What is a cloud energy storage integrated service platform?

The cloud energy storage integrated service platform is a cloud energy storage ecosystem built based on battery energy storage, combined with advanced technologies such as the Internet of Things, 5G, big data, cloud services and blockchain.

How a cloud energy storage platform works?

The physical transmission party controls the charging and discharging to realize the electric energy delivery. Finally, the platform settles the revenue of each party according to the traded electricity. The goal is to minimize the total system cost during the operation and dispatch of the cloud energy storage service provider.

What is cloud energy storage?

Cloud energy storage (CES) in the power systems is a novel idea for the consumers to get rid of the expensive distributed energy storages (DESSs) and to move to using a cloud service centre as a virtual capacity.

How can cloud energy storage help reduce energy costs?

Using the difference between peak and valley electricity prices can maximize economic benefits and reduce energy costs. The cloud energy storage service platform fully exploits the value of decentralized energy storage resources to participate in grid load regulation.

What is an energy platform?

The energy platform is made of three key components: the energy cloud for the generation, distribution and storage of electricity, the digital platform for industry and customers to jointly manage the energy infrastructure, and the transaction platform for trading and services.

How much electricity does a cloud energy storage device supply?

The energy storage device reported to the cloud energy storage platform from 6 p.m. to 7 p.m. can supply electricity. The electrical energy supplied by the energy storage device is shown in Table 2. This time, the distribution network's power demand is 675 kWh.
