Chemical storage could offer high storage performance due to the high storage densities. For example, supercritical hydrogen at 30 °C and 500 bar only has a density of 15.0 mol/L while methanol has a hydrogen density of 49.5 mol H<sub>2</sub>/L methanol and saturated dimethyl ether at 30 °C and 7 bar has a density of 42.1 mol H<sub>2</sub>/L dimethyl ether.

Main Takeaways of the article: Liquid hydrogen offers higher energy density and is easier to transport and store compared to gaseous hydrogen. Liquefaction is very energy ...

Through a selection of relevant literature, this article briefly summarizes technology trends in liquid hydrogen storage tanks and their respective applications. A slightly ...

Key factors limiting the use liquid hydrogen are high energy penalty due to high energy consumption of hydrogen liquefaction (>10 kWh/kg LH<sub>2</sub> on average) and high hydrogen boil-off ...
