

Are rechargeable magnesium batteries a viable energy storage solution?

Rechargeable magnesium batteries (RMBs) are gaining attention as promising energy storage solutions due to their high volumetric capacity (3833 mAh/cm<sup>3</sup>), inherent safety from dendrite-free anodes, cost-effectiveness (~\$2/kg), and environmental sustainability [1,5,150].

Can magnesium batteries power EVs?

Support CleanTechnica's work through a Substack subscription or on Stripe. With relatively low costs and a more robust supply chain than conventional lithium-ion batteries, magnesium batteries could power EVs and unlock more utility-scale energy storage, helping to shepherd more wind and solar energy into the grid.

Are rechargeable magnesium batteries a viable post-lithium battery system?

Provided by the Springer Nature SharedIt content-sharing initiative Rechargeable magnesium batteries (RMBs) have emerged as a highly promising post-lithium battery systems owing to their high safety, the abundant Magnesium (Mg) resources, and superior energy density. Nevertheless, the sluggish kinetics has severely limited the performance of RMBs.

Why do we need a magnesium battery?

Magnesium enables dendrite-free operation, improving battery safety and lifespan. New cathodes and electrolytes address issues like Mg<sup>2+</sup> diffusion and anode passivation. Mg batteries suit EVs, grid storage, aerospace, and portable devices due to low cost. AI and materials engineering may speed up Mg battery commercialization and research.

Why are magnesium batteries better than lithium ion batteries?

Magnesium batteries offer ~3833mAh/cm<sup>3</sup> capacity, nearly twice that of lithium-ion batteries. Magnesium enables dendrite-free operation, improving battery safety and lifespan. New cathodes and electrolytes address issues like Mg<sup>2+</sup> diffusion and anode passivation. Mg batteries suit EVs, grid storage, aerospace, and portable devices due to low cost.

How do rechargeable magnesium batteries work?

Rechargeable magnesium batteries (RMBs) operate via the reversible migration of Mg<sup>2+</sup> ions between the anode and cathode through an electrolyte medium. RMBs are broadly categorized into aqueous and non-aqueous systems based on the solvent type used in the electrolyte.
