

Problems and suggestions encountered by energy storage manufacturers

What challenges hinder energy storage system adoption?

Challenges hindering energy storage system adoption As the demand for cleaner, renewable energy grows in response to environmental concerns and increasing energy requirements, the integration of intermittent renewable sources necessitates energy storage systems (ESS) for effective utilization.

Why is energy storage a problem?

The lack of direct support for energy storage from governments, the non-announcement of confirmed needs for storage through official government sources, and the existence of incomplete and unclear processes in licensing also hurt attracting investors in the field of storage (Ugarte et al.).

Why are investors not able to invest in energy storage?

But currently, the running programs and unbalanced pricing in the market, the lack of certainty and certainty in regulatory affairs and the economy, are challenges that prevent investors from entering the field of energy storage (Castagneto Gisse et al., 2018).

Why is non-acceptance of energy storage systems a problem?

Non-acceptance of EES systems by the industry can be a significant obstacle to the development and prevalence of the utilization of these systems. To generate investment in energy storage systems, extensive cooperation between facility and technology owners, utilities, investors, project developers, and insurers is required.

How does market design affect energy storage technology development in Europe?

Inadequate market design in Europe is more in favor of traditional technologies and pushes the market towards more use of old technologies rather than preparing for the presence of emerging technologies, and this can affect and reduce the speed of development and spread of new energy storage technologies (Ruz and Pollitt, 2016).

What are energy storage systems (EES)?

Energy Storage Systems (EES) come out to be central technologies that can effectively supplement the gap and serve as storage equipment for saving the surplus energy when it is generated more than what is required and release the same when energy demand is high.
