What is PCM & how does it work?

PCM is engineered material that can effectively store and release energy, and undergo a change in phase (for instance, solid-solid, solid-liquid, liquid-gas or solid-gas) as it is warmed or cooled.

What is a good PCM?

Proven PCMs include hydrated salts, paraffins, fatty acids, alcohols and more. Each material has its own performance profile, so the most appropriate PCM can be closely matched to the specific temperature requirements of each shipment.

What is VIP & PCM?

The combination of high-performance VIP and PCM panels that provide more precise temperature management inside the cargo container for hours or days, ensures safe and reliable transportation across the globe. This configuration can provide extended hold times of up to 240 hours.

What is a passive container?

Passive containers do not use batteries or active compressor/thermoelectric cooling. Instead, they rely only on the container design, insulation materials and any refrigerants used to maintain the required temperature needed for these high-value pharmaceutical products to remain effective from the point of origin to their final destination.

Latent heat thermal energy storage (LHTES) affords superior thermal energy capacity and compactness but has limited applications due to the low thermal conductivity of phase change materials (PCMs). Several researches have focused on the improvement of heat transfer and reducing the total melting time of PCMs in LHTES system. Few researches, however, have ...

Effect of rectangular container height on melting behavior of PCM is investigated. o Scaling analysis is used to describe the melting process. o The melting time is extended by 50% as the height of the container is increased from 12 cm to 48 cm. o A significant thermal stratification was observed inside the PCM container and absorber surface.

Abstract This paper explores the dynamic thermal performance of Phase Change Materials (PCMs) melting in an inclined finned rectangular container with the top heating mode. Internal external fins are provided to the back surface of the PCM tank considering its applications in the large duty cycle photovoltaic thermal management systems, top heating mode heat sinks and ...
